

Tablet Monitor works as the 2nd Display and Rotation

Press Release

While all other brands function only as a primary display, Hi-Tech Instrument's newest break through development, the LCD WriteScreen[®] Tablet Monitor, can function as a secondary display and supports display rotation.

Almost all laptop computers (including Tablet PC) have VGA ports an external monitor can connect to. In recent days, many desktop computers also have installed multiple-display VGA cards, allowing the connection of multiple monitors for displaying extended screens. Using the tablet monitor as a 2nd display opens up the doors for many applications.

Applications that involve employee-customer interaction can be boosted by setting the tablet monitor as the secondary monitor. The primary monitor will face the employee while the tablet monitor will face the customer. Examples are: hospital/clinic patient registration signing, business contract paper signing, merchant purchasing signing, etc. A single computer with multiple displays is a better, easier and cheaper alternative than two (2) computer systems in signing applications.

The secondary monitor feature is also useful for presentations. It allows one screen to display the presentation and the other screen, invisible to the audience, to display notes to the presenter. The WriteScreen[®] Tablet Monitor provides video pass-through connection such that the presenter can write annotation on the tablet monitor while the projector can display the presentation to the audience. Examples are: classroom teaching, office meeting room presentation, etc. Extended monitor display from a primary monitor is better and more useful than mirror (clone) monitor display in most of cases.

The WriteScreen[®] comes with 1) a 15" LCD Tablet Monitor and an electronic pen; 2) the *Hi-Tech Annotation* software that provides virtual whiteboard and write-on-any-screen features, including the ability to write annotation on the *Windows Media Player* and *PowerDVD* screen while the video is playing 3) a proprietary device driver that supports primary or secondary display at any orientation with 0, 90, 180, and 270 degree rotation. Supported Systems are Windows 98, 2000, ME, XP, Vista. Hardware connection is USB and VGA/SVGA/XGA. The price of *LCD WriteScreen[®] Tablet Monitor* is much cheaper than a Tablet PC.
